DEPARTMENT OF RADIODIAGNOSIS

MRI SCAN OF BRAIN

PATIENT'S NAME : MR. VASANT D JADHAV

AGE : 43 yrs/ M

REF. CLINICIAN : DR. GANDHI

DATE : 7-Nov-16

MRI SCAN NO. : 7695

REG NO : 105721

CLINICAL NOTES : H/o headache.

MRI of the brain was performed in T1 and T2 W signal intensities in multiple planes with FLAIR. It reveals:

- ▶ There is no focal or diffuse areas of altered signal intensity seen in the brain.
- ▶ The basal ganglia and thalami appear normal.
- ▶ The visualised cerebellum and the brainstem appear normal.
- ▶ Pituitary and corpus callosum appear normal.
- ▶ No evidence of intra-cerebral / extra-axial / intra-ventricular hematoma.
- ▶ The ventricular system appears normal. No midline shift.
- ▶ The basal cisterns & cortical sulcal spaces appears normal.
- ▶ Polypoidal mass is seen in the left ethmoid and maxillary sinuses extending into the nasal cavity and measuring approx. 5.0 x 4.0cms. It shows heterogenous appearance.

CONCLUSION :

No significant intracranial abnormality is detected in this study.

Polypoidal mass is seen in the left ethmoid and maxillary sinuses extending into the nasal cavity and measuring approx. 5.0 x 4.0cms. It shows heterogenous appearance.

This needs further evaluation with CT PNS & contrast, possibilities includes polyp or less likely neoplasm.
